

→ Loop Back Address: The IP address with the first byte equals to 127 is used for the Loop Back address which is an address used to test software on a device. When this address is used, the packet never does not leave the device. It simply returns to the protocol software.

127.X.Y.Z

→ Address for Private Networks:

Class	Netid	Blocks
A	10	1
B	(172.16 to 172.31)	16
C	(192.168.0 to 192.168.255)	256

→ Unicast Communication: One to One
 Multicast Communication: One to Many
 Broadcast Communication: One to All
 No Broadcasting is allowed at the global level. A device can NOT send a message to all hosts in the internet.

* Classless Addressing:

In classless addressing variable length blocks are assigned that belong to no class. we can have a block of 2 addresses, 4 addresses, 128 addresses and so on.

- In this architecture, the entire address space (2^{32} addresses) is divided into blocks of different sizes.

Rules:

Rule 1: The number of addresses in a block must be a power of 2 ($2, 4, 8, 16, \dots$)

Rule 2: The first address must be evenly divisible by the number of addresses.

For example, if a block contains 4 addresses, the first address must be divisible by 4.

4. If the block contains 16 addresses,

The first address must be divisible by 16.

Examples:

1. Which of the following address of a block

205.16.37.32

Sol: Convert every

$$\begin{array}{r} 205 \\ 16 \\ 37 \\ \hline 256^3 \quad 256^2 \quad 256^1 \end{array}$$

check $(256)^0$.

$$\text{Here } \frac{32}{16}$$

2. 190.16.42.44

$$\begin{array}{r} 190 \\ 16 \\ 42 \\ 44 \\ \hline 256^3 \quad 256^2 \quad 256^1 \end{array}$$

$$34.17.17.30.80$$

$$\frac{80}{16} =$$

4. 123.45.24.57

$$\frac{57}{16} =$$

5. 205.16.37

$$\frac{32}{256} = X, 1$$

Examples:

1. Which of the following address can be the beginning address of a block that contains 16 addresses.

205.16.37.32

S1: Convert everything into decimal & divide by 16.

10/4

$$\begin{array}{r} \text{205.16.37.32} \\ \text{---} \\ 205 \quad 16 \quad 37 \quad 32 \\ | \quad | \quad | \quad | \\ 256^3 \quad 256^2 \quad 256^1 \quad 256^0 \end{array}$$

check $(256)^0$ divided by addresses.

Here $\frac{32}{16}$ is divisible. So this first address.

Yes.

2. 190.16.42.44, 1/16

$$\begin{array}{r} \text{190.16.42.44} \\ \text{---} \\ 190 \quad 16 \quad 42 \quad 44 \\ | \quad | \quad | \quad | \\ 256^3 \quad 256^2 \quad 256^1 \quad 256^0 \end{array}$$

3. 17.17.30.80, 1/16

$$\frac{80}{16} = 5 \cdot \checkmark, \text{ YES}$$

4. 123.45.24.52, 1/16

$$\begin{array}{r} \text{123.45.24.52} \\ \text{---} \\ 123 \quad 45 \quad 24 \quad 52 \\ | \quad | \quad | \quad | \\ 256^3 \quad 256^2 \quad 256^1 \quad 256^0 \end{array}$$

5. 205.16.37.32, 1/16

$\frac{32}{256} = X$, for $\frac{256}{256}$ it should end with 0.

6. $190.16.42.0$

$\frac{0}{256} - \checkmark$ - YES, 0's is in 256^0 place unit

7. $17.17.32.0$ - YES

8. $123.45.24.52$ - NO

9. $205.16.37.32$ /1024 address.

check 4,256 divisible

$\frac{32}{256} - X$ No

10. $190.16.42.0$ (1024 - 52)

$\frac{0}{256} - \checkmark$ - \downarrow

($190.16.42$ (even though not an IP test for
mathematical) $X = \frac{0}{256}$)

$\frac{42}{4} = X$

so NO.

$256 - 1.0$ in decimal.

11. $\frac{205.16.37.32}{1.0}$

But for math it can be

$\frac{32}{256} = X$ NO written as

= $205.16.37.32$

12.

$17.17.32.0$

$\frac{0}{256} - \checkmark$, $\frac{32}{4} = \checkmark$ YES.

$$13. 123 \cdot 49 \cdot 24 \cdot 52 = \frac{52}{256} = \text{No.}$$

* Format of classless addressing address:

$x \cdot y \cdot z \cdot t/n$

- In Classful addressing, when an address is given we can first find the class of the address then we can apply the mask to find the beginning address and the range of addresses.
- In Classless addressing, when an address is given, the block address belongs to, cannot be found unless we have the mask.
- The n after the slash defines the number of bits that are the same in every address in the block.
- If $n=20$, the 20 left most bits are identical in each address with 12 bits not the same.
- The prefix is another name for the common part of the address range.
(similar to NetID)

- The Suffix is the varying part (similar to host ID). The Suffix length is 32-n.
- Classful addressing is a special case of classless addressing.
- we can AND the mask & the address to find the first address.

→ Prefix Length:

Prefix Mask

	128.0.0.0	192.0.0.0	224.0.0.0	240.0.0.0	248.0.0.0	252.0.0.0	254.0.0.0	255.0.0.0
1	255.128.0.0	255.192.0.0	255.224.0.0	255.240.0.0	255.248.0.0	255.252.0.0	255.254.0.0	255.255.0.0
2	128.0.0.0	192.0.0.0	224.0.0.0	240.0.0.0	248.0.0.0	252.0.0.0	254.0.0.0	255.0.0.0

8	128.0.0.0	192.0.0.0	224.0.0.0	240.0.0.0	248.0.0.0	252.0.0.0	254.0.0.0	255.0.0.0

3 find the no. of
addresses is

formula

7.7

what is the first address
 $128 - 2^{n+3}$
 $82 - 01000000$
 $162.199.120.64$

$140.120.84.24/20$?
 $120 - 16 + 1$

$80 - 0110$
 160.120

3 find the no. of
addresses is

formula

7.7

10/06

- what is the first address - $167 \cdot 199 \cdot 170 \cdot 82 / 27 ?$

$$27 - 24 + 3$$

$$82 - \boxed{01010010} \\ 01000000 - 64$$

$$A - 167 \cdot 199 \cdot 170 \cdot 64 / 27$$

2. $160 \cdot 120 \cdot 84 \cdot 24 / 20 ?$ first address

$$20 - 16 + 4$$

$$84 - \boxed{01010100} \\ 01010000 - 80$$

$$160 \cdot 120 \cdot 80 \cdot 0 / 20 //$$

3. Find the no. of addresses in the block if one of the addresses is $160 \cdot 120 \cdot 84 \cdot 24 / 20$

$$\frac{32-n}{2} = \frac{32-20}{2} = \frac{12}{2} = 6096.$$

Formula

The Total No. of Addresses in the Block is

$$32-n$$

4. How to find last address in the block

Method: The Number of address - 1

first address

Method 2

we add first address to the complement of
the mask.

e.g.: /29

$$\textcircled{1} \quad 2^{\frac{32-29}{2}} = 2^3 = 2^3 = 8 - 1^8 = 7$$

~~PD - 000000010~~

$$\textcircled{2} \quad 111 = \text{BSF} > \text{OR} \text{ PDI } \text{PDI} = 4$$

e.g. 8: Using Method ①, find last address of subnet

(140.120.84.24 /20)

$$\begin{array}{r} 32-20 \\ 2^{\frac{32-20}{2}} = 2^4 = 16 \\ (20)_{10} = 10000_2 = 1010_8 = 1096_{10} - 1 \\ \hline 1095 \end{array}$$

Convert 1095 to 256 decimal

$$1095 = 1096 - 1 = 1095_{10} = 10001001_2 = 16.0$$

$$1095 = 1096 - 1 = 1095_{10} = 10001001_2 = 16.0$$

$$\begin{array}{r} 1095 \\ - 1 \\ \hline 1094 \end{array}$$

140.120.

Now change given address to first address &

Then add 15.255

140.120.80.0

$$\begin{array}{r} 15.255 \\ + 140.120.80.0 \\ \hline 140.120.95.255 /20 \end{array}$$

using Method ②

Q8.1

12 ans is 00-0.1111 11111111

15 - 255

FA = 140.120.80.0

15.255

140.120.95.255 / 20

8.2

e.g.: Find the Block if one of address 190.87.140.202/29

so for find block we need FA & LA.

190.87.140.202 / 29

FA:

129 - 245

202 -

11001010

11001000 - 200

Find PA - [190.87.140.200/29]

LA - 11 - 7

[190.87.140.207 / 29] . 1

→ In class less addressing, The last address in the block does not necessarily end in 255.

→ In CIDR Notation, The block granted is defined by the first address & the prefix length.

CIDR - classless Inter Domain Router.

* Subnet in Classless Addressing

If the number of Subnets is S , then
number of extra 1's in the prefix length is

$$\log_2 S$$

$$2^{\log_2 S} = S$$

$$S = 2^{\log_2 S}$$

number of extra 1's

Ex 1 Block 130.34.12.16/26, we need 4 subnets
prefix length - ?

$$\log_2 4 = 2^{\text{extra } 1's}$$

$$26 + 2 = 28$$

what are subnet address & range of each subnet?

$$\text{Block} - 130.34.12.16/26 \rightarrow R - 10 - A$$

$$\text{No. of address} - 2^{28-26} = 64 - \text{OP1}$$

$$\text{How many subnets} - 4$$

$$\text{How many address per subnet} - \frac{64}{4} = 16$$

$$\text{Range of 1st subnet} - 130.34.12.16/28$$

$$\text{FA of 1st subnet} - 130.34.12.16/28$$

$$\text{is between } 130.34.12.16 \text{ and } 130.34.12.31$$

$$\text{Range of 2nd subnet} - 130.34.12.32/28$$

$$\text{FA of 2nd subnet} - 130.34.12.32/28$$

2nd - 130.34.12.80 /28 FA

130.34.12.95 /28 60

2nd - 130.34.12.96 /28 61

130.34.12.1011 /28 62

4th - 130.34.12.112 /28 63

130.34.12.127 /28 64

ct - 130.34.12.164 /26 65

0011111 - 63 - 130.34.12.127 /28

10/11

3. 14.24.74.0 /24 , 2 SNO with 64 address

$$2 \cdot 64 = 128$$

$$2 \cdot 32 = 64$$

$$3 \cdot 16 = 48$$

$$4 \cdot 4 = 16$$

$$\frac{256}{256}$$

$$\begin{array}{r} 32 \\ 16 \\ 4 \end{array}$$

$$\log 64 = 6 - 126$$

$$\log 32 = 5 - 127$$

$$\log 16 = 4 - 128$$

$$\log 4 = 2 - 30$$

14.24.74.0 /24

14.24.74.0 /24

14.24.74.63 /24

14.24.74.64 /24

14.24.74.127 /24

14.24.74.128 /24

CA - 190.100.255.255 /16

so

(a) 190.100.0.0

190.100.63.255

(b) 190.100.64.0

190.100.127.255

(c) 190.100.128.0

190.100.159.255

190.100.160.255

190.100.255.255

→ IP is a connectionless protocol.

→ In a Connectionless Service, the network layer protocol treats each packet independently. The decision about the route of a packet is made individually by each router.

* Delivery of a Packet

- Direct

- Indirect

1. Direct Delivery:

Direct delivery occurs when the source and destination of the packet are located in the same physical network or if the delivery is between the last router and the destination device.

2. Indirect Delivery:

In an indirect delivery the packets go from router to router until it reaches the one connected to the same physical network as its final destination.

The Last delivery is always a direct delivery.

* Forwarding Techniques:

1. Next Hop Method:

In this Technique the routing table holds only the address of the next hop instead of information about the complete route.

10/13 2. Network Specific Method:

Instead of having an entry for every destination host connected to a physical network, we have one entry that defines the address of other destination network itself.

3. Default Method:

Router R₁ routes the packets to hosts connected to network N₂. For the rest of the internet router R₂ is used; instead of using all networks in the entire internet.

host A can just have one entry called Default.

- * Forwarding with classful addressing:
 - Each routing table has 3 columns:
 1. The Network address of the destination network tells us where the destination host is located at supernet level.
 2. The Next-Hop address tells us to which router the packet must be delivered for an indirect delivery. This column is empty for a Direct delivery.
 3. The Interface number defines the outgoing interface from which the packet is sent out. A router is usually connected to several networks. Each connection has a different interface.

- The Forwarding Module follows these steps:
 1. The destination of the packet is extracted.
 2. The destination address is used to find the class of the address. This is done by shifting the address 28 bits to the right. The result is a 4-bit number between 0 and 15.

0-7 - Class A

8-11 Class B

12-13 Class C

14 Class D

15 Class E

3. Find the Network address. This is done by masking.

4. The class of the address & the Network address are used to find the Next-Hop address and the interface number.

5. The ARP module uses the Next-Hop address & the interface number to find the physical address of the next router. Then the Data link layer delivers the packet to the Next-Hop.

10/18

* Sub Simplified forwarding module in classfull

address with Subnetting:

→ Subnetting happens inside the organization.

1. The module extracts the destination address.

2. The destination address and the mask are used to find the subnet address.

* 3. The routing table is searched to find the next-hop address and the interface number.

* 4. The next-hop address and the interface number are given to ARP.

* Destination address

→ In CF address, the routing table has 3 columns.

→ In classless address, the routing table has 4 columns.

* Simplified forwarding module (Class Less addressing)

→ we need to include the mask ($/n$) in the routing table.

→ In classless addressing we need at least 4 columns.

10/20

* Address Aggregation

To reduce the size of the routing table

The idea of address aggregation

was introduced

→ Address Aggregation!

Blocks of addresses for many organizations are aggregated into one larger group.

→ Longest Mask Matching!

Routing in classless addressing uses longest mask matching. The Routing Table is sorted from the longest mask to the shortest mask.

→ Hierarchical routing with ISP's!

To solve the problem of gigantic routing tables, we can create ~~route~~ a sense of hierarchy in the routing tables.

→ Routing Tables - Searching Algorithms!

- classful addressing

- classless addressing

→ - Static Routing Table

→ - Dynamic Routing Table

→ common fields in a table
- Mask, Network address, Next-hop, Interface, flags, Reference count, Use
